PRIORITY APPLM. INFO.: CA 1976-268001 19761216
ABSTRACT: A 1/Ophilized soln. of triethylenetetraminehexa (methylenephosphomic acid) (I) and SnC12 in a sterile ampul is reconstituted with sterile saline contg.
Na99mTc04 to form a 99mTc complex which may be injected i.v. for bone scintigraphy. Thus, 100 mg i and 2.5 mg SnC12.2H20 are dissolved in 20 mL sterile distd. water, the pH adjusted to 4, the soln. divided into 2 mL portions, placed in 10 mL ampule, and lyophilized under amptic conditions. At
                                                                     A 19780620

                                                                                                                                        APPLICATION NO. DATE
  At the time of use, 2-8 mL sterile saline contg. .apprx.40 mCi Na99mTcO4 is added to each ampul and the soln. made up to 10 mL with saline. I is prepd. by refluxing triethylenetetramine-4HCl with PCl3 in aq. soln. with dropwise addn. of CH2O. I was pptd. with Pb(NO3)2, and Pb was then removed with H2S as PbS.

JP 04048799 PRIORITY APPLN. INFO.: ABSTRACT: PKLORITY APPLN. INFO.:

US 1984-616985 A 19840604
ABSTRACT:
Phosphonic acid derive, of org. amines having N and P linked by an alkylene group, complexed with particle-emitting radionuclides (e.g., 1525m, 175Yb, 177Lu,, 159Gd) are useful in the treatment of calcific tumors (bone metastases). Ethylenediaminetetramethylenephosphonic acid (EDTMP), hydroxyethylethylenediaminetrimethylenephosphonic acid (HEEDTMP), and trias (2-aminoethyl)seminehexamethylenephosphonic acid (TTMMP) were prepd. by the reaction of corresponding amines with H3PO3 followed by reaction with HCHO. Nitrilotrimethylenephosphonic acid (NTMMP) was prepd. by the reaction of NMC1 with H3PO3 followed by reaction with HCHO. BDTMP, DTPMP, HEEDTMP, and TTMMP were complexed with 1535m; BDTMP, DTPMP, HEEDTMP, and NTMP were complexed with 175Yb; and BDTMP and HEEDTMP were complexed with 175Yb; and BDTMP and HEEDTMP, DTPMP, HEEDTMP, and 159Gd. Rats injected i.v. with EDTMP, DTPMP, HEEDTMP, or TTHMP complexed with 1535m; BDTMP, DTPMP, HEEDTMP, and NTMP were dompted for specific acid in the second send countries.

CA 1985-479260 19850416 JP 1985-271679 19851204

US 1984-616985 A 19840604

(50-100 .mm.L) were sacrificed after 2 h. Organs were removed and counted for biolocalization. A significant amt. (28-58%) of radioactivity was concd. in the skeletal system with a very little soft tissue uptake. Similar results were also obsd. with other complexes in rate and rabbits. Two non-N-contg. phosphonic acid derivs., 1-hydroxyethylidene-1,1-diphosphonic acid (HEDP) and methylenediphosphonate (MDP) were complexed with 1555m. The Sm-MDP exhibited undesirable high liver uptake and Sm-HEDP showed a low skeletal uptake with

 ABSTRACT:
 Contrast agents for scanning of calcified tissue by NMR are prepd. which comprise complexes between (1) an amino di- or poly-phosphonate in which the phosphonate group comprise different C atoms, and (2) a paramagnetic metal
ion. A complex of Gd with diethylenetriamine tetramethylphosphonate (EDTMP) was prepd. by mixing 0.043 g Gd(NO3)3.5H2O with 0.046 g EDTMP in 5 mL acetate buffer pH 5.6. One mL of 1M NaOH was added, followed by 4 mL of acetate
 to give a 1 mM soln. of the complex.
                                       NMR contrast agent calcified tissue; gadolinium amine phosphonate NMR contrast agent

ABSTRACT: The title compds. (I; Y = 0, NR1; R1 = H, alkyl, aralkyl, aryl; R2 = H, alkyl) were prepd. as metal-chelating ligands for use in diagnostic medicine as contrast agents and relaxation enhancement agents. 1-Oxa-4,7,10- triazacyclododecane and CLCM2CO2H in H2O at pH 9.5 were attirred for 15 h at 45.degree. to give I (R2 = H, Y = 0) (II). II was added to aq. Gd(OAc)3, the pH adjusted to 3, and the soln. was heated at 88.degree. for 20 min. to give the Gd(III) deriv. of II.

ABSTRACT,
The title compds. [I; Rl = H, metal ion equiv.; R2 = H, B, BCOCH2, R1R4NZCH2,
(un)satd. Cl-10 slkyl, slkanoyl, optionally substituted by OH, slkoxy; B =
biomol. residue; R3;R4 = H, Cl-16 slkyl, optionally substituted by OH, slkoxy; R3R4N = 5- or 6-membered heterocyclyl; R2;R3 may represent a second
tetraezacyclododecane molecy bound via an (un)substituted, difunctional acyl
or
hydrocarbon group; Z = CO, Cl-10 slkylene, optionally interrupted with Oand
having OH and slkoxy substituents], their salts, metal complexes, and
conjugates with biomols., were prepd. as imaging sids for x-ray,
scintigraphic,
and tomog. diagnosis (no data). N,
N,N'-Tria(p-tolylsulfonyl)diethylenetriam
ine di-Na salt and N,N-bis[(p-tolylsulfonyl)oxy]ethyl)benzylamine were heated
at 100.degree. in DMF to give 1-benzyl-4-7,10-tris(p-tolylsulfonyl)-1,4,7,10tetraezacyclododecane. This was detosylated by heating at 50.degree. in
HBF/HOAC/PhOH and alkylated with BFCH2CO2Et to give I (Rl = Et, R2 = PhCH2).
The latter was debenzylated by hydrogenation over Pd/C, and the resulting
triester was sapond. with 3 N NaOH and, without isolation, treated with
Gd(OAc)3 and stirred 3 h at 60.degree. to give the Gd(III) complex of I (Rl =
R2 +H) (1:1).

L7 ANSWER 1 OF 1 HCAPLUS COPYRIGHT 2003 ACS (Continued)

ABSTRACT: The title contrast agents are Ca or Mg salts of physiolog. compatible chelates of lanthanide or transition metals, with the general formula I or N(CH2X)3

(II) [X = CO2Y, PO3HY, CONHOY; Y = H, metal ion equiv. or biocompatible cation (.gtoreq.2 equivs. lanthanide or transition metal, .gtoreq.1 equiv. Ca or Mg); A = CHR2CHR3 etc.; R1 = H, Me; R2,3 = H or (combined) (CH2)3-4; V = X. CH2OH. CONH(CH2)37; n = 1-12], and are administered in a pharmaceutically acceptable carrier before NNR tomog., to give enhanced images due to shortening of magnetic relaxation times of water mols. The Ca salt of the Mn complex of trans-1,2-diaminocyclohexane-N,N,N',N'-tetramethylenephosphonic acid (DCTP)

was prepd.; at 10-2 M in water it gave spin-lattice (T1) and spin-spin (T2) relaxation times of 16 and 8, resp., vs. 32 and 22 for a similar salt with the analogous tetraacetate ligand; in plasma the values were 15 and 10, resp., vs. 25 and 50.5. The LD50 in mice was 4.9 mmol/kg vs. 0.2 mmol/kg for the tetraacetate complex.

ANSWER 1 OF 1 HCAPLUS COPYRIGHT 2003 ACS (Continued)

ABSTRACT:

N-Contg. macrocycles are prepd. which are useful as ligands for complexes for NRR imaging and x-ray radiol. (no data). 2,6-Dimethyl-1,4,7,10-tetraazacyclododecane-N,N',N'',N''-tetraacetic acid was prepd., as was the methylglucamine salt of the Gd complex of the macrocycle.

19891121
ABSTRACT:
Bone marrow is suppressed by the administration of 153Sm, 159GA, 166Ho or 90Y complexes of aminophosphonic acid ligand(s) contg, the 1,4,7,10-tetrazacycloddceane moiety. A refluxing mixt. of 3.48 g 1,4,7,10-tetrazacycloddceane; 14 mL water, 17.2 mL conc. HCl and 7.2 g H3PO4 was treated with 13 g 37% HCHO, to give 1,4,7,10-tetrazacycloddceanetetramethylenephospho nic acid (DOTMP). This was treated with a 90YCl3 soln. in HCl, followed by pH adjustment to 7.5 (NaOH) to give 90Y-DOTMP. 90Y-DOTMP (1 mCl), injected i.v. into rats decreased the white blood cell count. The complexes may be used in the treatment of leukemia, lymphoma, myeloma, Hodgkin's disease, sickle cell anemia or thalassemia. The complexes may be used in conjunction with known chemotherapeutic agents.
 ABSTRACT:
                                                                                                                                                                                                                                                                                                                                                                         INDEX TERM:

= NH2 or deriv.) were also prepd.

ABSTRACT: ABSINGL:
Title compds. I [m, n, R4 = 0-3; q = 0-6; R-R3 = H, P(O)(XH)R4 (.gtoreq.1 R .noteq. H); X = O, S; R4 = H, alkyl, alkoxy; L = bond or divalent group; Z = H or reactive functional group) and their salts and complexes were prept. as antitumor and/or imaging agents (no data). For example, 1,4,7,10-terrazzecycloddecame was condensed with MeP(OEL) 2 and paraformaldehyde to give I (R5 = H). This acid formed complexes with Y, Gd, and 90Y. The latter was prepd. in 82* radiolabeling yield, and was stable in aq. buffer (pH 6.8) at 298 K in the presence of a 500-fold excess of DTPA for 72 h. Three addnl. I

L13 ANSWER 1 OF 1 HCAPLUS COPYRIGHT 2003 ACS (Continued)

ABSTRACT: ABSTRACT:
Title compds. I [m, n, d = 0-3; q = 0-6; R-R3 = H, P(O) (XH)R4 (.gtoreq.1 R .noteq. H); X = O, S; R4 = H, alkyl, alkoxy; L = bond or divalent group; Z = H or reactive functional group] and their salts and complexes were prepd. as antitumor and/or imaging agents (no data). For example, 1,4,7,10-tetraazacyclododecane was condensed with MeP(OEt)2 and paraformaldehyde to

give tetraphosphinate ester II (RS = Et), which was hydrolyzed in refluxing HCl to give II (R5 = H). This acid formed complexes with Y, Gd, and 90Y. The latter was prepd. in 82% radiolabeling yield, and was stable in aq. buffer (pH 6.8) at 298 K in the presence of a 500-fold excess of DTPA for 72 h. Three addnl. I

= NH2 or deriv.) were also prepd.

L14 ANSWER 1 OF 1 HCAPLUS COPYRIGHT 2003 ACS (Continued) WO 1989-US5782 A 19891215 OTHER SOURCE(S): MARPAT 114:95158 OTHER SOURCE(S): MARPAT 114:95158
ABSTRACT:
1535m, 159Gd, 166Ho, 177Lu, 90Y or 175Yb are complexes with macrocyclic aminophosphonic acids contg. the 1,4,7,10-tetraezacyclododecane moiety and having the N and P interconnected by (un)substituted alkylene. The complexes are useful in the treatment of bone-metastatic cancer. A refluxing mixt. of 3.48 g 1,4,7,10-tetraezacyclododecane, 17.2 mL conc. HCl, 7.2 g H3PO4 and 14 mL mL water was treated with 13 g HCHO, to give 1,4,7,10-tetraazacyclododecane-1,4,7,10-tetramethylphosphonic acid (DOTMP). This was complexed with 166Ho at pH 7-8, to give DOTMP-166Ho. Biodistribution studies of DOTMP-166Ho in rats showed strong accumulation in the bone. SUPPL. ARSTRACT:
1535m. 1596d. 166Ho, 177Lu, 907 or 1757b are complexes with macrocyclic
aminophosphonic acids contg. the 1,4,7,10-tetraszacyclododecane moiety and
having the N and P interconnected by (un)substituted alkylene. The complexe
are useful in the treatment of bone-metastatic cancer. A refluxing mixt. of
3,48 g 1,4,7,10-tetraszacyclododecane, 17.2 mL conc. HCl, 7.2 g H3PO4 and 14
mL water was treated with 13 g HCHO, to give 1,4,7,10-tetraazacyclododecane-1,4,7,10-tetramethylphosphonic acid (DOTMP). This was complexed with 166Ho at pH 7-8, to give DOTMP-166Ho. Biodistribution studies of DOTMP-166Ho in rats showed strong accumulation in the bone.
 SUPPL. TERM:
anticancer;
                                                         radionuclide complex tetraazacyclododecane deriv

L17 ANSWER 1 OF 1 HCAPLUS COPYRIGHT 2003 ACS (Continued)

ABSTRACT:

Anovel process for the prepn. of azamacrocyclic or acyclic aminophosphonate ester derivs., e.g., I, is disclosed. The process concerns the reaction of an appropriate azamacrocyclic or acyclic primary or secondary amine with trislkyl phosphites and paraformaldehyde.

SUPPL. TERM: azamacrocyclic aminophosphonate; phosphonate azamacrocyclic 50-00-0, Formaldehyde, reactions 102-85-2, Tri phosphite 107-15-3, Ethylenediamine, reactions INDEX TERM: 102-85-2. L18 ANSWER 1 OF 1 HCAPLUS COPYRIGHT 2003 ACS (Continued)

ABSTRACT:
A novel process for the prepn. of azamacrocyclic or acyclic aminophosphonate ester derivs., e.g., I, is disclosed. The process concerns the reaction of an appropriate azamacrocyclic or acyclic primary or secondary amine with trialkyl phosphites and paraformaldehyde.

azamacrocyclic aminophosphonate; phosphonate azamacrocyclic acyclic 50-00-0, Formaldehyde, reactions 102-85-2, Tributyl phosphite 107-15-3, Ethylenediamine, reactions SUPPL. TERM: INDEX TERM: phosphite 107-15-3, Ethylenediamine, reactions

Trimethyl phosphite 122-52-1, Triethyl phosphite
294-90-6, Cyclen 923-99-9, Tripropyl phosphite

PRIORITY APPLN. INFO.:
ABSTRACT:
A conjugate of a monoclonal antibody to cells of the hematopoietic system with an .alpha.- or .beta.-emitter is useful for treatment of malignant hematopoietic diseases. Suitable .alpha.-emitters are 211At and 212Bi, and suitable .beta.-emitters are 90%, 188Re, 186Re, 670%, 166Ro, and 1535m; the radionuclide is bound to the antibody with or without use of a complexing agent. The radionuclide is not an I isotope. The monoclonal antibody may bind
 ABSTRACT:
bind
e.g. to a surface antigen of granulocytes or granulocyte precursors or to
.gtoreq.1 epitope of CD66. Thus, a purified anti-CD66 monoclonal antibody was
subjected to partial reductive cleavage with 2-mercaptoethanol and
lyophilized.
This antibody was labeled with 188Re by mixing with a soln. of freshly prepd.
Na188Re04 in the presence of tetra-Na 1,1,3,3-propanettraphosphonate Sn(II)
complex. This conjugate, when administered i.v. to patients with chronic
myeloid leukemia at 100 mci/wk, accumulated in the bone marrow and led to a
high rate of destruction of endogenous hematopoietic stem cells and 100%
acceptance of autologous or allogeneic bone marrow transplants.
                                                                                                                                                                                                                                                                            INDEX TERM

ABSIMACT: Redicimmunoconjugates of .alpha.-emitters (e.g. 211At, 212Bi) or .beta.-emitters (e.g. 90%, 186Re, 188Re, 68Cu) with cytotoxic monoclor satibodies are prepd. without the use of complexing agents by partial

antibodies are prepd. without the use of complexing agents by partial reductive cleavage with 2-mercaptoethanol and direct coupling of the radionuclide to the free SH groups on the antibody. The antibody may be of mouse, human, or other mammalian origin, and may be humanized, recombinant, fragmented, or intact. Treatment of malignancies, eep. of hematopoietic tumors, with these conjugates can replace high-dose chemotherapy and whole-body irradn. and is assocd with less severe side effects. Thus, a monoclonal antibody (protein and cDNA sequences of heavy and light thain variable regions given) was cleaved with 2-mercaptoethanol, diafiltered under N2, freeze-dried, reconstituted with a reducing soln. contg. tetra-Na 1,1,3,3-propanetetraphosphonate Sn(II) complex, and labeled with Na188ReO4.

PRIORITY APPLN. INFO.:
ABSTRACT:
A conjugate of a monoclonal antibody to cells of the hematopoietic system with an alpha.- or .beta.-emitter is useful for treatment of malignant hematopoietic diseases. Suitable .alpha.-emitters are 211At and 212Bi, and suitable .beta.-emitters are 90%, 188Re, 186Re, 6700, 166Ho, and 153Bm; the radionuclide is bound to the antibody with or without use of a complexing agent. The radionuclide is not an 1 isotope. The monoclonal antibody may bind
 ABSTRACT:
bind
e.g. to a surface antigen of granulocytes or granulocyte precursors or to
.gtoreq.1 epitope of CD66. Thus, a purified anti-CD66 monoclonal antibody was
subjected to partial reductive cleavage with 2-mercaptoethanol and
lyophilized.
This antibody was labeled with 188Re by mixing with a soln. of freshly prepd.
Nais8Re04 in the presence of tetra-Na 1,1,3,3-propanetetraphosphonate Sn(II)
complex. This conjugate, when administered i.v. to patients with chronic
myeloid leukemia at 100 mci/wk, accumulated in the bone marrow and led to a
high rate of destruction of endogenous hematopoietic stem cells and 100%
acceptance of autologous or allogeneic bone marrow transplants.
                                                                                                                                                                                                                                                                                                                            INDEX TERM:
                                                                                                                                                                                                                                                                                                                            INDEX TERM:

PRIORITY APPLN. INFO.:
  ABSTRACT:
  Redicimmunoconjugates of alpha.-emitters (e.g. 211ht, 212Bi) or
beta.-emitters (e.g. 90Y, 188Fe, 188Re, 58Cu) with cytotoxic monoclonal
antibodies are prepd. without the use of complexing agents by partial
 reductive cleavage with 2-mercaptoethanol and direct coupling of the radionuclide to the free SH groups on the antibody. The antibody may be of mouse, human, or other mammalian origin, and may be humanized, recombinant, fragmented, or intact. Treatment of malignancies, esp. of hematopoietic tumors, with these conjugates can replace high-dose chemotherapy and whole-body irradn. and is assocd. with less severe side effects. Thus, a monoclonal antibody (protein and cDNA sequences of heavy and light chain variable regions given) was cleaved with 2-mercaptoethanol, disfiltered under N2, freeze-dried, reconstituted with a reducing soln. contg. tetra-Na 1,1,3,3-propanetetraphosphonate Sn(II) complex, and labeled with Na188ReO4.
                                                        monoclonal antibody radiolabeling cancer treatment; radiotherapy tumor rhenium isotope antibody Antibodies ROLE: BAC (Biological activity or effector, except

| ABSTRACT: | |
| 153Sm, 159Gd, 166H | o, 177Lu, 90Y or 175Yb are complexes with macrocyclic |
| aminophosphonic ac | ids contg. the 1,4,7,10-tetraazacyclododecane moiety and |
| | interconnected by (un) substituted alkylene. The complexes |
| are useful in the | treatment of bone-metastatic cancer. A refluxing mixt. of |
| 3.48 q 1,4,7,10-te | traazacyclododecane, 17.2 mL conc. HCl, 7.2 g H3PO4 and 14 |
| mL | |
| water was treated | with 13 g HCHO, to give 1,4,7,10-tetraazacyclododecane- |
| 1,4,7,10-tetrameth | ylphosphonic acid (DOTMP). This was complexed with 166Ho at |
| pH 7-8, to give DO | TMP-166Ho. Biodistribution studies of DOTMP-166Ho in rats |
| showed strong accur | mulation in the bone. |
| SUPPL. TERM: | radionuclide complex tetraazacyclododecane deriv |

    ABSTRACT:
An antimicrobial compn. is given, made of titanium dioxide, barium sulfate and/or zinc oxide particles, having successive coatings of silver, in some cases a coating of zinc and/or copper compds. such as zinc oxide, copper[II] oxide and zinc silicate, silican dioxide, alumins, and a dispersion aid such as
     dioctyl azelate. The compns. are esp. suitable for incorporation into plastics, and do not cause coloration or staining of the plastic.

COUNTRY: United States

MENT TYPE: (CLINICAL TRIAL)

(CLINI

I/II dose escalation myeloablative trial. 166Ho with beta-emission (half-life, 26.8 h; beta-particle energies, 1.85 MeV [511] and 1.77 MeV [481]; gamma-photons, 80.6 keV [6.64] and 1.35 MeV [0.94]) was complexed to DOTMP, a macrocyclic tetraphosphonate. Pharmacokinetics, dosimetry,

biodistribution were studied. METHODS: Patients were treated at

biodistribution were studied. METHODS: Patients were treated at escalating dose levels of 20, 30, and 40 Gy to the bone marrow in combination with high-dose melphalan, with or without total-body irradiation, to evaluate toxicity and efficacy. After infusion with 1,110 MBq (30 mCi) of 166Ho-DOTMP for evaluation of biodistribution and dosimetry calculation, patients received the calculated amount of radioactivity for therapy in a single administration based on estimated dose calculations. RESULTS: Thirty-two patients participated in the study and were then treated. The average amount of administered radioactivity was 74.3 GBq (2,007 mCi) (range, 21.5-147.5 GBq [581-3,987 mCi]) of 166Ho-DOTMP, CONCLUSION: 166Ho-DOTMP has physical and pharmacokinetic characteristics compatible with high-dose myeloablative treatment of multiple myeloma.

HJAGE: English

Complexes between the trivalent lanthanide ions and the macrocyclic

chelate 1,4,7,10-tetraezacyclododecane-N,N',N'',N''-tetra(methylene

phosphonate) (DOTP) were examd. by high-resoln. NMR spectroacopy. The

proton spectra of the diamagnetic La(DOTP)5- and Lu(DOTP)5- complexes

provide evidence for very rigid chelate structures with the

ethylenediamine-contg. chelate rings essentially locked into a single

conformation at room temp. The activation energy for ethylenediamine

chelate ring interconversions in these complexes is approx. 100 kJ/mol,

considerably higher than that reported previously for the corresponding

Ln(DOTA)- complexes (DOTA is the tetraecetate analog of DOTP).

Lanthanide-induced shifts are reported for all 1H, 13C, and 31P nuclei in

11 Ln(DOTP)5- complexes. The proton spectra of these complexes display

unusually large lanthanide-induced shifts, one showing a spectrum in

the 1H resonances span 900 ppm. The contact and pseudocontact the 1H resonances span 900 ppm. The contributions to these shifts were sepd. using Reilley's .-independent method and the resulting pseudocontact lanthanide-induced NMR shifts were in excellent agreement with those calcd. for a structure derived using

mol. modeling methods. The pseudocontact shifts provide evidence for Ln(DOTP)5- chelates which have virtually identical structures along the lanthanide series, with the possible exception of Tm(DOTP)5-. 7440-60-0D, Holmium, complexes with tetraexacyclodecanetetra(methy lenephosphonate) 91987-74-5D, lanthanide complexes RL: RPR (Properties) (soln. structure of, NMR in study of) 7440-60-0 CAPLUS

acid (DOTMP) and were a susset of personnel phase
phase
[/II dose escalation myeloablative triel. 166Ho with beta-emission
(helf-life, 26.8 h; beta-particle energies, 1.85 MeV [51%] and 1.77 MeV
[48%]; gamma-photons, 80.6 keV [6.6%] and 1.38 MeV [0.9%]) was complexed
to DOTMP, a macrocyclic tetraphosphonate. Pharmacokinetics, dosimetry,

biodistribution were studied. METHODS: Patients were treated at

biodistribution were studied. METHOUS: rectents were closed.

scalating

dose levels of 20, 30, and 40 Gy to the bone marrow in combination with
high-dose melphalan, with or without total-body irradiation, to evaluate
toxicity and efficacy. After infusion with 1,110 MBq (30 mCi) of
166Mo-DOTMP for evaluation of biodistribution and dosimetry calculation,
patients received the calculated amount of radioactivity for therapy in a
single administration based on estimated dose calculations. RESULTS:
Thirty-two patients participated in the study and were then treated. The
average amount of administered radioactivity was 74.3 GBq (2,007 mCi)
(range, 21.5-14.5 GBq [581-3,987 mCi)) of 166Mo-DOTMP, CONCLUSION:
166Mo-DOTMP has physical and pharmacokinetic characteristics compatible
with high-dose myelosblative treatment of multiple myeloma.
